

Fraud Prevention & Risk Threshold Policy

Document ID: FRAUD-POLICY-2025-A | Version: 1 | Effective: 2025-01-01 to present

This policy defines the risk signals and thresholds used to route order exception cases to human review versus automated resolution. Risk scoring considers behavioral patterns, not return frequency alone — a customer's lifetime value and return-reason consistency are weighted alongside raw return count to avoid penalizing legitimate high-engagement customers.

Mandatory Human Review Triggers

Signal	Threshold	Action
Fraud/risk score	Any flag present	Always route to human review, regardless of case value
Address changed same-day as return request	Present	Flag for identity-consistency review
"Item never arrived" vs. carrier "delivered"	Any occurrence	Route to human review with delivery evidence attached
Return count	> 10 in 90 days	Review for pattern, weighted with LTV and reason consistency

Risk Score Distribution (Illustrative)
